Invasive Weeds on the Cloverleaf Lakes

This year's aquatic surveys have identified significant growth of troublesome invasive weed species in our lake, including Starry Stonewort, Curly leaf pond weed and Eurasian Milfoil. The invasive weeds grow very densely and spread quickly. They can form very dense mats of vegetation near the surface, which choke out native plants and aquatic life. The mats interfere with activities such as swimming, fishing, and boating, which in turn lower property values. **Below are photos to help identify the invasive weeds.**

Starry Stonewort

Eurasian Milfoil

Curly-Leaf Pond

Cloverleaf Lakes Protective Association and concerned stakeholders have teamed in the past to manage the invasive weeds on several occasions during the past 25 years. It is time to address the invasive weeds again and make plans going forward. Watch your US Mail Box for more information and how you can assist. Please see the other side of this post card to receive information by E-Mail.
